Part A.

1. Attributes.

The attributes are the small specific details of a column is known as attribute.

eg:

id	name	dob	salary

→ This fields is known as attributes of a table.

The attributes have a specific values that tells to the data base to which type of data can be store and what is the permitted value of that field.

Domain.

Domain is permitted values to store the data.

eg:

create table tbl-student (studentid integer, name varchar(50),
course varchar(20));

The integer, varchar(50) are the domains that have a permitted value to store the data. In the case more amount of value can store we must specify the max limit.
